Steps to Generate a Mohr Circle in MATLAB

Creating a Mohr circle in MATLAB involves a series of steps, from defining the stress components to plotting the circle with appropriate annotations.

1. Define the Stress Components

Begin by specifying the normal stresses (σ_x), (σ_y) and shear stress (τ_{xy}) acting on the element.

```matlab

sigma_x = 50; % Normal stress in MPa

sigma_y = 20; % Normal stress in MPa

tau_xy = 15; % Shear stress in MPa

```

2. Calculate the Center and Radius of the Mohr Circle

The center (C) and radius (R) of the circle are derived from the stress components:

$$

C = \frac{\sigma_x + \sigma_y}{2}

$$

$$

R = \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}

\]

```matlab

C = (sigma_x + sigma_y) / 2;

R = sqrt(((sigma_x - sigma_y)/2)^2 + tau_xy^2);

```

3. Define the Angle Range for Plotting

Choose a range of angles (\(\theta\)) over which to plot the circle, typically from 0 to 180 degrees.

```matlab

theta_deg = linspace(0, 180, 360);

theta_rad = deg2rad(theta_deg);

```

4. Calculate the Stress Transformation Points

Using the stress transformation equations, compute the normal (\(\sigma_\theta\)) and shear stresses (\(\tau_\theta\)) for each rotation angle:

\[

\sigma_\theta = C + R \cos(2\theta)

\]

\[

\tau_\theta = R \sin(2\theta)

\]

```matlab
sigma_theta = C + R cos(2 theta_rad);
tau_theta = R sin(2 theta_rad);
```

5. Plot the Mohr Circle

Use MATLAB?s plotting functions to visualize the circle and stress points.

```matlab
figure;
circle_x = C + R cos(theta_rad);
circle_y = R sin(theta_rad);
plot(circle_x, circle_y, 'b', 'LineWidth', 2);
hold on;
% Plot the center point
plot(C, 0, 'ro', 'MarkerSize', 8, 'MarkerFaceColor', 'r');
% Plot the principal stresses
sigma_1 = C + R; % Max principal stress
sigma_2 = C - R; % Min principal stress
plot([sigma_1, sigma_2], [0, 0], 'ks', 'MarkerSize', 8, 'MarkerFaceColor', 'k');
% Add labels and title
xlabel('Normal Stress \sigma (MPa)');
ylabel('Shear Stress \tau (MPa)');
```

```
title('Mohr Circle in MATLAB');

grid on;

axis equal;
```

6. Annotate and Interpret Results

Identify the principal stresses (\(\sigma_1, \sigma_2\)), maximum shear stress, and their orientations directly from the plot.

theta_deg = linspace(0, 180, 360);
theta_rad = deg2rad(theta_deg);
circle_x = C + R cos(theta_rad);
circle_y = R sin(theta_rad);
figure;

Mohr Circle MATLAB: A Comprehensive Guide for Stress Analysis and Visualization

The Mohr Circle MATLAB tool is an essential resource for engineers and students working in the field of mechanics of materials, structural analysis, and solid mechanics. It offers an efficient and visual method to analyze and interpret the state of stress at a point within a material or structure. By combining the power of MATLAB?s computational capabilities with the intuitive geometric representation of the Mohr circle, users can gain deep insights into complex stress states, principal stresses, maximum shear stresses, and stress transformations. This article aims to provide a detailed overview of Mohr circle in MATLAB, exploring its features, applications, pros and cons, and practical implementation techniques.

Introduction to Mohr Circle and MATLAB Integration

The Mohr circle is a graphical representation of the state of stress at a point, illustrating how normal and shear stresses transform under different orientations. Traditionally, it involves plotting a circle in the normal-shear stress plane, where principal stresses and maximum shear stresses can be visually identified. MATLAB, a high-level programming environment, offers robust tools to automate the creation of Mohr circles, making complex stress analysis faster, more accurate, and more interactive.

Integrating Mohr circle concepts into MATLAB involves scripting functions that compute principal stresses, maximum shear stresses, and the corresponding angles, then plotting these results dynamically. MATLAB?s plotting functions, combined with its numerical computation prowess, make it an ideal platform for developing custom Mohr circle visualizations suited for educational, research, or industrial purposes.

Mathematical Foundations and Implementation in MATLAB

Understanding the mathematical basis of Mohr circle is essential for effective implementation. MATLAB scripts typically follow these steps:

1. Input Stress Components

- Normal stresses along x and y axes: ?_x, ?_y.
- Shear stress in the xy plane: ?_xy.

2. Calculate Principal Stresses

Using the formulas:

\[

\sigma_{1,2} = \frac{\sigma_x + \sigma_y}{2} \pm \sqrt{\left(\frac{\sigma_x - \sigma_y}{2}\right)^2 + \tau_{xy}^2}

\]

This calculation yields the maximum and minimum normal stresses.

3. Determine Maximum Shear Stress

\[

\tau_{max} = \frac{\sigma_1 - \sigma_2}{2}

\]

which is visually represented as the radius of the Mohr circle.

4. Plotting the Mohr Circle

- Center of the circle: \(\frac{\sigma_x + \sigma_y}{2}\).
- Radius: \(\tau_{max}\).
- Use MATLAB?s `rectangle` function with 'Curvature' set to [1, 1] to draw circles or `viscircles` from the Image Processing Toolbox.

Sample MATLAB code snippet:

```matlab

% Input stress components

sigma_x = 50; % MPa

sigma_y = 20; % MPa

tau_xy = 10; % MPa

% Calculate principal stresses

sigma_avg = (sigma_x + sigma_y) / 2;

diff_sigma = (sigma_x - sigma_y) / 2;

sigma_1 = sigma_avg + sqrt(diff_sigma^2 + tau_xy^2);

sigma_2 = sigma_avg - sqrt(diff_sigma^2 + tau_xy^2);

% Calculate maximum shear stress
```

```
tau_max = sqrt(diff_sigma^2 + tau_xy^2);

% Plot Mohr Circle

theta = linspace(0, 2pi, 100);

x_center = sigma_avg;

r = tau_max;

x = x_center + r cos(theta);

y = r sin(theta);

figure;

plot(x, y, 'b', 'LineWidth', 2);

hold on;

plot([sigma_x, sigma_y], [tau_xy, -tau_xy], 'ro');

xlabel('Normal Stress (MPa)');

ylabel('Shear Stress (MPa)');

title('Mohr Circle');

grid on;

axis equal;
```
